## For better use of our Catalog

## 〈For specifications〉

Specifications in this product catalog are subject to change without prior notice．
Detailed specifications are omitted for some of the products due to limited space．
Please inquire and ask for individual specification sheets when ordering．

## 〈Information〉

Our product catalog consists of two volumes．
This catalog，the first volume，carries product information on switches，trimmers，attenuators，circuit protectors，

Please see the second volume for other products such as sensors and motors．

The switches described in this catalog include
DIP switches and Operating switches．

Concerning Operating switches such as order to
be made products and standard products，there is a common annotation related to switches at last half catalog．Please refer it．
For other products，in each product catalog $\Theta$ logo or a description to point out order to be made products on each item at the catalog．
If there is no indication，it is a standard products．

## Note prior to placing order

Please do not use our products under conditions or environments not described in this catalog．Even under the conditions or environments described in this catalog，if you want to use our products for applications requiring high reliability（These include，but are not limited to，nuclear power control equipment，railroad equipment，aviation equipment，vehicle equipment，combustion equipment，medical equipment，entertainment equipment，and disaster prevention equipment），be sure to contact our point of contact beforehand．
The details of warranty shall be as per the descriptions in this document and we shall not be liable for any damage on you resulting from the use of any equipment or device（including control systems） which is not in accordance with this document（hereinafter referred to as＂use in violation＂）．In the case where you resell our products，we shall not be liable for any damage on a third party resulting from use in violation by the third party，and even if we make payment to the third party in connection with such use in violation regardless of the name by which such payment may be called， we may demand the whole amount thereof from you．

## 〈Warranty Period〉

The warranty period is one year from the date of delivery．The warranty is only applicable to the product itself， not applic a ble to con sumable products such as batteries and etc．

## 〈Warranty Coverage〉

If any malfunctions should occur due to our fault，NIDEC COMPONENTS warrants any part of our product within one year from the date of delivery by repair or replacement at free of charge．However，warranty is not applicable if the causes of defect should result from the following con ditions：
－Failure or damages caused by inappropriate use，inappropriate conditions，and inappropriate handling．
－Failure or dam ages caused by inappropriate modifications，adjustment，or repair．
－Failure or damage caused by technically and Scientifically unpredictable factors．
－Failure or damage caused by natural disaster，fire or unavoid able factors．

The DIP switch is generally defined as "Dual In-line Package Switch".
Since we marketed our first Dip Rotary Code Switch S-1000 in 1978, we have been expanding the range of DIP switch series.
Mounted on the printed circuit board incorporated in information processing equipment, data communications equipment and control equipment, etc., DIP switches are mainly used as a means of setting such as for programs and circuits as well as circuit switching. Based on our special expertise in contact technology and sealing technology, we are manufacturing reliable switches that can satisfy the needs for digitalizing, upgrading and down-sizing of equipment.
Our DIP switches are classified as follows:

- DIP Slide Switch

CHS series is a half-pitched thin type SMD slide switch conforming to EIAJ SOP Configuration Standard.
Full-pitched slide switch CFS series has been newly added, moreover, 1 mm -pitched CVS series, piano switch CHP series and CFP series have also added, meeting various needs.

- DIP Rotary Code Switch

This switch is designed to rotate the rotor so that a code signal is output by making a binary connection between common terminal and each of terminals 1, 2, 4, 8, directly.
A decimal or hexadecimal step of real code and complementary code are provided as circuit configurations.
Three switch types are available according to configurations; knobbed type, top setting type and side setting type.
In addition, this switch is classified into a board insertion type and an SMD type according to the mounting method.

## APPLICATIONS

## SWITCHES

photovoltaic power generation

earth leakage breaker

## APPLICATIONS SWITCHES

## APPLICATIONS

## SWITCHES

security alarm

## security

rail \& in-vehicle

car navigation system

## APPLICATIONS

## SWITCHES

electric power tool

electric drill
disk grinder

sensor device

medical equipment (ex. ultrasonograph)
non-contact temperature meter

## PACKAGING <br> DIP SWITCHES

$※$ In addition to the DIP switches in this chapter，the following notes on the page 155 contain common notes applied to some of the pushbutton switches（detect switches），slide switches，and rotary switches described later．

## MARKING <br> DIP SWITCHES

1. Production date code (No. 1)

Production date code is exhibited on each product as shown in below.

Production date code

| year | code | Month | code |
| :---: | :---: | :---: | :---: |
| 1999 | 9 | 1 | A |
| 2000 | 0 | 2 | B |
| 2001 | 1 | 3 | C |
| 2002 | 2 | 4 | D |
| 2003 | 3 | 5 | E |
| 2004 | 4 | 6 | F |
| 2005 | 5 | 7 | G |
| 2006 | 6 | 8 | H |
| 2007 | 7 | 9 | J |
| 2008 | 8 | 10 | Y |
| 2009 | 9 | 11 | L |
| 2010 | 0 | 12 | M |
| $\ldots$ | $\cdots$ | - | - |
|  |  |  |  |

Date code, in principle, consists of one digit and one capital letter. Per above table the last digit of year represents, a year while a capital letter a month.

## Note

- Date code marking position is per outline drawing of each model.
- Marking of Part No. is made for the following models.

| S-1000A/2000A | RD |  |
| :--- | :--- | :--- |
| SA-5000 | SS-10 (Rotary switches) |  |
| S-8000 | RS/RG (Rotary switches) |  |

Example
Manufactured in Sep. of 2008.

Models of date code application

| DIP switches | Slide switches |
| :--- | :--- |
| CVS | CJS |
| CHS | CAS |
| CHP | CL-SA |
| CFS | CL-SB |
| CES | CRFS |
| CFP | CMS |
| CYP | CUS |
| RD | CSS |
| S-1000A/2000A | Rotary switches |
| SC-1000/2000 | CS-4 |
| SD-1000/2000 | CS-7 |
| S-4000 | SS-10 |
| SA-5000 | RS/RG |
| SA-7000 | Pushbutton (Detect) switches |
| S-7000 | CL-DA |
| SH-7000 | CL-DB |
| S-8000 |  |

## MARKING DIP SWITCHES

1. Production date code (No. 2)

Production date code is exhibited on each product as shown in below.

The model that this marking method is applicable: Rotary switch CS-32

Production date code

|  | Year |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Stamping position | Upper right |  |  | Upper right |
| Month | $\begin{aligned} & 1999 \\ & 2003 \\ & 2007 \end{aligned}$ | $\begin{aligned} & 2000 \\ & 2004 \\ & 2008 \end{aligned}$ | $\begin{aligned} & 2001 \\ & 2005 \\ & 2009 \end{aligned}$ | $\begin{aligned} & 2002 \\ & 2006 \\ & 2010 \end{aligned}$ |
| 1 | A | N | A | N |
| 2 | B | P | B | P |
| 3 | C | Q | C | Q |
| 4 | D | R | D | R |
| 5 | E | S | E | S |
| 6 | F | T | F | T |
| 7 | G | U | G | U |
| 8 | H | V | H | V |
| 9 | J | W | $J$ | W |
| 10 | K | X | K | X |
| 11 | L | Y | L | Y |
| 12 | M | Z | M | Z |

In principle, capitals per the table are used, commencing with January of 2001 as A in order. The same arrangement will be repeated after 48 months or 4 years.

## 2. Coating and potting

If the switch is coated or potted, the movable parts may lock, making readjustment difficult.
Further, if coating or potting is made, make sure that the hardening temperature does not exceed $70^{\circ} \mathrm{C}$.
In actual coating and potting, please make sure before use that the using conditions differ respectively.
Please note that the CVS, CHS CHP, CFP, CYP, CES \& Slide switches CJS, CAS, CL-SA, CL-SB, CRFS, CMS, CUS, CSS are not of sealed construction and therefore cannot be coated or potted.For details, please refer to page 152.

## HANDLING NOTES DIP SWITCHES

## 1. Caution for storage

When storage of the products, it must consider terminal soldering-ability, packaging function with temperature and humidity may effect the product. Especially, be caution on the below items.

1) Under High temperature and High humidity, the package will accelerate aging variation. It is recommended to store the product under room temperature $25^{\circ} \mathrm{C}$ with relative humidity $75 \%$.
2) To avoid store under sulfidizing gas/corrosive gas environment.
3) Handle with care to avoid the terminal change of shape.
4) To avoid direct daylight and dust.
5) Only open the standard package at the last minute before use.
6) When storing the switches, please take precautions such as putting them in vinyl bags to avoid terminal discoloration. And do not store the switches at high temperature, high humidity,
or where harmful gas exists.
For products manufactured 3 to 6 months before, depending on their storage location, reinspection is recommended before use.
7) When terminal discoloration is found, clean the discolored areas before use.

## 2. Using Environment

Be caution, it is not suitable for the below conditions.

- Sulfidizing gas, corrosive gas, reducing gas of atmosphere
- Rapid cooling of solvents
- Long time dipping into solvents (specially at high temperature)
- High humid environment

## 3. Soldering condition

Generally, it is possible to use soldering construction method.
However, if use flow soldering,it does require to consider carefully condition of wave soldering.
(The amount of flax applied to the switches has to be minimized. After apply flux,it must carry out pre-heat process.)
It may not suitable for condition of high package density or equipment.

Infrared reflow soldering < SMD type in common >
For lead free soldering, it is recommended as indicate on the below temperature profile drawing. However, concerning infrared heater style, It depends on physical object's color and material. The infrared absorb fraction varied, heating degree will be changed. If the temperature of product is more than $260^{\circ} \mathrm{C}$, it will change the shape of product. Be caution, do not excess temperature $260^{\circ} \mathrm{C}$ on the surface of the product.

- Infrared reflow soldering

## HANDLING NOTES DIP SWITCHES

- Flow soldering
<Through hole type in common>
Use Rosin series flux with non-corrosive
When apply flux, make sure do not overflow on PCB

After apply flux, it must carry out pre-heat.
Make sure the product does not touch soldering.
If the product touch soldering, the product shape will be changed. It causes production function degradation.
The temperature of soldering bath should be at $245 \sim 260^{\circ} \mathrm{C}$.
The dipping time is $3 \sim 5$ second per operation. The total dipping time must not exceed 10 seconds.
For flow soldering, it is recommended as indicate on the below temperature profile drawing.

- Flow soldering

$\mathrm{Tp} \leqq 260^{\circ} \mathrm{C}$ (Peak temperature)
Recommended profile for Lead-free soldering
<S-7000, SH-7000, DRS/DRR, S-1000A/2000A,
SC-1000/2000, SA-5000, S-8000, RD, Rotary switches SS-10/S-2050, RS/RG in common >
(C type of S-7000, SH-7000, SC-1000/2000)
The amount of flux applied to the switches has to be minimized.
The contact section will be sealed by O ring. Although the flux does not get inside the switch. If the flux remain between up rotor and cover, The torque may be heavy. Due to this, it must minimally apply flux. After the soldering, please wash off after soldering.
< SA-7000, SD-1000/2000 (C type) in common >
Due to non seal structure, please apply flux on terminal section only. After soldering, do not wash off.
<CVS-01C and CFS, CFP, CYP, CES, Slide switches CL-SB, CRFS, CMS (C type) in common>
Due to open structure, please apply flux on terminal section only. After soldering, do not wash off. ( CFS, CYP are washable type, it can be washed. )
- Manual soldering (Through hole type)

For soldering by soldering gun, it is recommended to use a small soldering gun under $380^{\circ} \mathrm{C}$ within 3 seconds. The soldering gun tip must not touch to the housing resin, but only to the terminal.

[^0]4. Cleaning
< CHS(All of these items,washable type only with seal tape), S-7000, S-1000A/2000A, SA-5000, S-8000, Slide switches CJS, CAS, Rotary switches CS-32, CS-4, SS-10/S-2050 in common >
It can be cleaned in general. Be caution on the following points.

- After the soldering, make sure the product temperature well cool off below room temperature $30^{\circ} \mathrm{C}$, then proceed for clearing. If we dip the product with hot temperature into cleaning liquid, the inner section of the product will be shrinking. The absorption phenomenon will be incurred. The cleaning liquid will go into inner section. Moreover, the products can not apply for special cleaning such as vacuum (decompression) cleaning. Do not use special clearing.
- The washable of wash liquid stated as below, it depends on the wash liquid. It may affect the product material and outlook. Be caution. CLEANTHROUGH 750HS [Kao Corporation]
Pine Alpha ST-100S [ARAKAWA CHEMICAL INDUSTRIES LTD.]
AK225AES [ASAHI GLASS COMPANY]
Water cleaning
Alcohol
※ It is not suitable for hydrocarbon series clear liquid.
※ Flon and trichloroethane are ozone-depleting substance.
From protect earth environment point view, please do not use them.
< S-4000, SA-7000, SD-1000/2000 in common >
- Due to non sealed structure, it can not be washed. Be caution.
< CVS, CHP, CFP, CES, Slide switches CL-SA,CL-SB,CRFS,CMS,CUS,CSS , Detect switchs CL-DA,CL-DB in common > - Due to open structure, it can not be washed. Be caution.
< CFS, CYP(Washable type), CS-7, SH-7000, DRS/DRR, SMR/SMRR, SC-1000/2000, Rotary switches CS-7 in common >
- Water cleaning

Alcohol

## HANDLING NOTES DIP SWITCHES

<RD, Rotary switches RS/RG in common >

- Regarding bolt of clean liquid, it must control of the flux density under(volume) $5 \%$. If the flux blot density above $5 \%$, the torque will be big. It will destroy click structure in the worse case.

5. Clean method

The method of apply cleaning stated as below.
Please minimized cleaning time.
Cleaning method

| Method | Applicability | Time | $\circ$ : Possible $\times:$ Not possible |
| :--- | :---: | :---: | :---: |
| Dipping |  |  | Note |
| Ultrasonic |  |  | - |
|  |  | Approx. <br> 2 min |  |
| Vapor |  |  |  |
| Showering |  |  |  |
| Brushing | $\times$ |  |  |

※ Series of CYP(washable type), CS-7, SH-7000 and SC-1000/2000 are applicable only dipping

After the cleaning, make sure it well dry. If it is not well dry, the varied of torque may incur electrical damage.
For CHS, CFS, CYP and Slide switches CJS, CAS, it is washable type.
when cleaning, do not peeling off the seal tape on the surface.
For vacuum (decompression) cleaning, be caution do not mix 2 different liquids.

- After cleaning, when peel off washable sealing tape, it might have some glue left over.

## 6. Combination of cleaning methods

The cleaning combination examples stated as below.
In this case, the cleaning time should be approximately
1 minute respectively.

1) Dipping ( 1 min ) + Vapor ( 1 min )
2) Ultrasonic ( 1 min ) + Dipping (1 min)
3) Showering ( 1 min ) + Vapor ( 1 min )
※ Be caution of the condition can be changed. Please check before actual cleaning.

## 7. Screwdriver to use

Be sure to use a small screwdriver with the correct size bit. If the handle is too large or the bit is too small, the switch end stops or setting slot may be damaged.

The driver bit size for a setup (reference value)

| Sereis | Tip thickness | Tip width |
| :---: | :---: | :---: |
| CS-32(Rotary switches) | $0.2 \sim 0.4$ | $1.5 \sim 1.7$ |
| CS-4(Rotary switches) | $0.4 \sim 0.5$ | 1.8 ~ 2.0 |
| S-4000 |  |  |
| SA-7000 | $0.5 \sim 0.6$ | $2.0 \sim 2.4$ |
| S-7000 |  |  |
| SH-7000 | $0.5 \sim 0.6$ | 2.0 ~ 2.2 |
| CS-7(Rotary switches) |  |  |
| SS-10/S-2050(Rotary switches) | $0.5 \sim 0.6$ | $2.0 \sim 2.5$ |
| S-1000A/2000A |  |  |
| SC-1000/2000 |  |  |
| SD-1000/2000 |  |  |
| SA-5000 |  |  |
| S-8000 |  |  |
| RS/RG(Rotary switches), RD | $0.5 \sim 0.6$ | $2.4 \sim 3.0$ |

< CVS, CHS, CHP, CFS, CFP, CYP , Slide switches CJS,CAS in common >
Be sure to use an dege of tweezers with tip width of about 0.8 mm to set up the switch.
8. Be caution of setting
<S-1000A/2000A, SC-1000/2000, SD-1000/2000, SA-5000, S-8000, Rotary switches SS-10/SA-2050 in common >
When set up the switch, rotate the shaft, it does feel clicking.
The switch does not have a stop structure in mid flow.
To avoid over click and stop in mid flow.
Moreover, for code switch case, code ambiguity may occur during transition from one code position to another. (Except SS-10 series)

## HANDLING NOTES DIP SWITCHES

< Pushbutton (Detect) switches CL-DA, CL-DB in common >

- When operate the switch, do not apply force over than rated load sufficiently.
- Be caution to use On (begin) position with sufficient allowance from travel distance.

For NC: ON $\rightarrow$ (OFF) type, make sure knob must return to the free position of operation setting

- The switch-restoring force cannot be used as the mechanism driving force of any set.
- The switch body and the knob of termination cannot be used as the operating body termination
- Make sure the operating body move in a direction where the knob moves, and the operating body is applied a force to the knob vertically. (See drawing below)

## 9. Strength of terminals

Do not bend or twist the terminals, as this will weaken or break the terminals.

## 10. Automatic mounting (SMD type in common)

The switches are compatible with automatic mounting
machines. However, confirm the type of mounting machine before use, since some machines are not applicable.

## 11. Coating (potting)

< S-7000, S-1000A/2000A, SA-5000, S-8000, RD, Rotary
switches CS-32, CS-4, SS-10/SA-2050, RS/RG in common >
If the switch is coated or potted, the movable parts may lock, making readjustment difficult.
Further more, if coating or potting is made, make sure that the hardening temperature does not exceed $70^{\circ} \mathrm{C}$.
Do not use coating and potting material containing the following substance.
Methylene chloride

- Thinner
Acetone Xylene
<S-4000, SA-7000, SH-7000, SD-1000/2000, Slide Switchs CAS, CVS, CHS, CHP, CFS, CFP, CYP, CJS, CL-SA, CL-SB, CRFS, CMS, CUS, CSS, Detect switchs CL-DA, CL-DB, Rotary switchs SC-1000/2000, CS-7 in common > Due to open structure, be caution do not coating or potting.

## GLOSSARY DIP SWITCHES

Stopper strength $\mathrm{mN} \cdot \mathrm{m}$
This shows the mechanical strength of the stops employed to limit the rotation of the rotor. A designated torque is applied to the switch axis, etc., and the strength is measured.

- Rotational torque $\mathrm{mN} \cdot \mathrm{m}$

This shows the operating force required to turn the rotor of a rotary type switch.

## Switching timing

Timing is either shorting or non-shorting.
Shorting: In this case, when switching contacts on the same circuit, the second connection is made before the previously connected terminal is electrically disconnected, after which the circuit completely switches over to the correct position.
Non-shorting: This case differs from shorting in that during the switch over, (2) is completely electrically disconnected from (1) and (3), after which (2) and (3) are connected at the new connection location.

Click (detent)
The method whereby the set position is checked in a sensory manner.

## Shear (Adhesion)

This test is to evaluate if any damages like electrode stripping, breaks, or cracks occur on SMD component soldered to the printed circuit board due to stress from the flank.

Pressure: 5 N
Holding time: 10 s
SMD sample

## GLOSSARY <br> DIP SWITCHES

- Contact
(1) A contact occurs when two insulated conductors touch each other.
(2) A contact is the small touching area between two conductors. In a switch, this is the conductive metal connection that controls the opening and closing of the electric circuit.

Operating force N
This is the maximum force when sliding a knob.

- Contact resistance [m $\Omega$ ]

This is the electrical resistance that occurs between contact points when a switch is closed.
Insulation resistance [M $\Omega$ ]
The insulation resistance value given by taking measurements at a given voltage between two terminals or between a terminal and ground.

Substrate bending
This test is to evaluate durability against stress due to distortion on the printed circuit at time or after SMD is mounted.

Dielectric strength [V]
This shows the specified voltage that can be applied between two terminals or between a terminal and ground without causing a short.

- Terminal strength N

This shows the strength of the tip of the terminal to withstand a static load for a fixed period of time without breaking.

Rating [VA]
This shows the maximum voltage and current capacity of a switch. Use in excess of the rated capacity will result in failure.

This is to evaluate heat resistance in soldering SMD component.

Solderability
This is a wetting evaluation test to find out how much new solder covers the terminals when immersed in the soldering bath, and to confirm the proper fillet formation in soldering process.

## Pull-off strength

This test is to evaluate adherence strength of SMD component soldered to the printed circuit board against peel off strength.

Low voltage \& current rating
This is operatable margin in the load range of low voltage \& low current.

Binary coded decimal notation (BCD)
This is a numbering system where each digit of a base 10 (decimal) number is expressed in binary notation.

- BCH

Binary Coded Hexa-decimal. Each row in hexa decimal is represented by binary coded system.

## - BCO

Binary Coded Octal. Each row in octal is represented by binary coded system.

SCSI
This is a micro computer control system and abbreviated from Small Computer System Interface, which controls 8 units.

Hexadecimal
This is a number system that uses 16 as a base. $A \sim F$ are used to express the base 10 numbers from $10 \sim 15$.

[^0]:    - Soldering iron

    3 s maximum at $350^{\circ} \mathrm{C}$
